

ESP32 FLIGHTSTACK – INTEGRATED 4-LAYER FLIGHT CONTROLLER

Architecture: onboard ESP32-WROOM-32E, MPU-9250, 3S-to-5V buck, 3.3V LDO, GPS, IBUS and four PWM ESC outputs.

SAFETY: Raw 3S LiPo input only. First power-up must use a current-limited bench supply; test motors without propellers.

POWER SYSTEM

POWER CONTROL

SW2 OFF pulls buck EN low through R14.

FOUR PWM ESC OUTPUTS – SIGNAL AND GROUND ONLY

Motor map: FL GPIO25 (CCW), FR GPIO4 (CW), RL GPIO26 (CW), RR GPIO32 (CCW).

ESC PORTS: signal + ground only. Do not connect ESC BEC outputs.

USB-C PROGRAMMING AND PROTECTED POWER MUX

USB VBUS and battery-derived 5 V are isolated by U7; simultaneous connection is permitted.

U7 IN1 = battery buck, IN2 = protected USB. Reverse/cross conduction are blocked internally.

SW2 OFF pulls buck EN low through R14.

INTEGRATED MPU-9250 IMU (SPI)

Place C10/C11/C12 within a few mm of U2. Keep U2 away from high-current motor and BEC paths.

FSYNC is grounded. AUX_DA/AUX_CL are unused. Pin 1 follows datasheet: reserved, tied to VDDIO.

FSYNC is grounded. AUX_DA/AUX_CL are unused. Pin 1 follows datasheet: reserved, tied to VDDIO.

FSYNC is grounded. AUX_DA/AUX_CL are unused. Pin 1 follows datasheet: reserved, tied to VDDIO.

ASSEMBLY / BRING-UP NOTES

- Inspect assembly, then apply raw 3S input from a current-limited bench supply.
- Confirm +3V3, then verify the battery ADC node with a multimeter.
- Confirm MPU-9250 WHO_AM_I and BMP280 detection before connecting ESCs.
- First motor tests must be performed without propellers.
- Document the PCB/IMU axis orientation in firmware before flight testing.
